Technical Skills

Micro-services Architect
Spring MVC
Spring boot
Spring Security, JWT Auth
Hibernate, JPA
Tibco connectors
Spring batch
GCP, Azure
Version management
Git and bit Bucket.
Splunk, AppDynamics PCF,
Datadog Grafanna
Prometheus
JIRA, Confluence and Rally
for board management.
CI/CD release
management.
Kafka, messaging queues

Functional Skills

TeamLead Exp 5+ years
Project Management
Domestic and
International payments
flow 6+ years

Experience

Duration- Sep 2021 to till date.

Organization: Ernst and Young (EY)

Roles and Responsibilities:

My current roles and responsibilities include both core development as well as team lead and project management activities, as a lead responsible for HLD, LLD and System design along with driving team members , handling service deployment process(CI/CD).

Project Summary: SEPA, SWIFT Payments Platform (HSBC).

Overview

The system is a highly scalable, secure SEPA, SWIFT payments platform designed to manage customer transactions from mobile/web applications. It integrates multiple services for payment processing, risk management, currency exchange, wallet operations, and ledger maintenance, ensuring reliability and compliance.

Key Components:

- Customer Interaction Layer: Mobile/Web clients served via CDN; AWS S3 for static content.
- Edge Router: Provides AuthN/AuthZ, DDoS protection, rate limiting, and request routing.
Acts as the first security layer before requests enter the VPC.
- Payments Platform Service: Central orchestration layer; uses Redis Cache for fast data access.

Core Services:

- Risk Engine: Fraud detection using rules and ML-based risk scoring.
- Wallet Service: Manages user wallets and balances; backed by Wallet Database.
- Ledger Service: Maintains transaction records for accounting and reconciliation.
- Payment Processing Service:
Handles actual payment execution.
Stores data in Payments Database.
Includes Retry Queue and Dead Letter Queue (DLQ) for fault tolerance.

Supporting Components:

- Event Log for auditing.
- Payment Scheduler for scheduled transactions.
- Payment Reconciliation Processor for ledger consistency.
- Webhooks based notification service to update customers via different channels (email, SMS).

External Integrations:

Connects to multiple Payment Service Providers (SWIFT, SEPA, currency exchangers) for transaction execution.

Education Qualifications

Bachelor of Engineering

PG from Centre for Development of
Advanced Computing (CDAC)

Trainings and Certifications:

6 Weeks Industrial Training at HEWLETT
PACKARD LTD

Azure certified developer

Clients served:

- ▶ MultiChoice, South Africa
- ▶ SABMiller, South Africa
- ▶ Lexis Nexis, United States
- ▶ Boeing, Chicago USA
- ▶ Tibco Software, USA
- ▶ HSBC bank, MasterCard

Organization: Mastercard

Project Summary: Mastercard Data Migration configurable generic utility.

Overview

Developed a configurable data migration tool for PostgreSQL that enables seamless migration between databases without relying on Hibernate entities. The solution is fully dynamic, driven by YAML-based configurations, and leverages Spring Batch for efficient processing.

Organization: Tibco Software

Project Summary: Tibco Products.

Duration-June-2017 to Sep 2021

Overview

Contributed to the development of multiple TIBCO Business Work 6 connectors, including Kafka, NetSuite, SharePoint, and REST services. Additionally, I worked on a Golang-based cloud connectors project using Flogo framework. Previously, I was involved in building various connectors and plugins for TIBCO Business Work BW5 (Java-based ActiveMatrix), such as JDBC, Mail, File, Java, FTP, JMS, REST (JSON/XML), HTTP, Swagger, and WADL.

Organization: Infosys Limited.

Project Summary: Boing and Lexus Nexus applications.

Duration- Dec-2015 to May 2017

Overview

Boeing client – Developed an application designed for early fault detection and resolution of airplane components. Given the complexity and large number of parts in an aircraft, identifying issues within strict SLA timelines is challenging. This system enables technicians to quickly pinpoint the root cause, significantly reducing troubleshooting time.

Lexus Nexus client – Built a system to process and extract metadata from uploaded documents, apply business logic to the extracted data, and generate outputs for inventory and invoice management.

Organization: Nihilent Technologies

Project Summary: NIP and MCA Gateway application.

Duration- April-2013 to Nov-2015

Overview

Project: NIP – Sales Cycle

Developed a solution to streamline the Project Initialization process within the organization by integrating CRM, ERP (NIMS), and Navision Reporting System to revamp the sales workflow. Previously, departments operated in silos; this project enabled seamless integration across teams.

The NIP Sales Cycle covers the entire process of initiating Request Proposals, Change Requests (CRs), Statements of Work (SOW), and Contracts, while managing the end-to-end process flow. The system also provides a standardized reporting mechanism for each prospect or opportunity.

Project: MCA Gateway Communication

Designed and implemented a system to integrate network protocols such as SMPP and SS7 with Java, enabling customer services via USSD codes over mobile networks. The solution was developed for a Direct-to-Home service provider in Africa to allow instant customer interactions, including quick recharge, balance checks, service activation/deactivation, and error logging.

Thanks.
